

Activity 5.2: Analyzing Blocked Designs

Cheese

Warning

- Submit via Gradescope, don't forget to assign pages to the questions in the outline!
- Delete any extraneous instructions (**like this box**) before submission (unless you are using the PDF template). *You will be deducted points from now on if you do not follow this instruction!*
- There is no coding required for this activity! **I would recommend you complete it using the Word or PDF versions**, but you are still welcome to use the .qmd template: [05.2-activity-factorial-blocking.qmd](#).
 - If you use the .qmd template, you will need to refer to the online instructions to see the referenced output

Scenario

An experiment is to be conducted to evaluate the effect of citric acid and salt on the moisture content (in %) of [mozzarella cheese](#). Typically, mozzarella cheese has a moisture content between 52 and 60%, but “low-moisture mozzarella” may have moisture content between 45-52%.¹ Mozzarella cheese can be made by mixing 1 gallon of milk, 1/4 tsp of liquid rennet, cheese salt, and citric acid.

Balls of mozzarella cheese will be made by using 4 different amounts of citric acid (1 tsp, 1.25 tsp, 1.5 tsp, 1.75 tsp) and 2 different amounts of cheese salt (1 tsp and 2 tsp). After storage in a cooler for 3 months, the moisture content of each mozzarella ball will be measured at three different random locations within the ball of cheese.

The researchers would like to include different types of milk as a blocking factor in their study. They went to the store and bought six different types of whole milk (e.g. from different brands, organic or not, etc.) and will run a randomized complete block design making 8 balls of cheese from each type of milk (one ball of cheese from each combination of levels of citric acid and salt). The order of mixing/making each ball of cheese will be randomized within each milk type.

¹Reference: <https://www.sciencedirect.com/topics/agricultural-and-biological-sciences/mozzarella-cheese>

Part A: Setup

1. Sketch a design blueprint

- Clearly indicate the experimental units *and* measurement units
- Clearly indicate the blocking factor (show grouping)
- Show how treatments are assigned within blocks

2. Describe the treatment and experimental structures (bullets is fine!)

3. In one sentence, explain why blocking is preferable to using milk type as an inclusion criterion.

4. For the RCBD analysis that we have learned so far, how should the researchers use the three measurements from each cheese ball?

5. Which of the following shows the *first couple of rows* of the **appropriate** data to use to analyze this study based on what we know so far? Fill in the blanks in the statement below to describe the data.

The appropriate data to use to analyze the cheese study is Data _____. The full dataset would have _____ rows, where each row represents one _____.

Data A

milk	cheese_ball	citric_acid	salt	location	moisture_perc
Organic Local	cheese_ball01	1.5 tsp.	2 tsp.	location01	60.09875
Organic Local	cheese_ball01	1.5 tsp.	2 tsp.	location02	57.79328
Organic Local	cheese_ball01	1.5 tsp.	2 tsp.	location03	58.82279
Organic Local	cheese_ball02	1.25 tsp.	2 tsp.	location01	59.00913
Organic Local	cheese_ball02	1.25 tsp.	2 tsp.	location02	60.91573
Organic Local	cheese_ball02	1.25 tsp.	2 tsp.	location03	61.35199

Data B

milk	cheese_ball	citric_acid	salt	mean_moisture_perc
Organic Local	cheese_ball01	1.5 tsp.	2 tsp.	58.90494
Organic Local	cheese_ball02	1.25 tsp.	2 tsp.	60.42562
Organic Local	cheese_ball03	1.25 tsp.	1 tsp.	56.82857
Organic Local	cheese_ball04	1.5 tsp.	1 tsp.	60.03801
Organic Local	cheese_ball05	1.75 tsp.	1 tsp.	61.50799
Organic Local	cheese_ball06	1 tsp.	1 tsp.	58.82087

Part B: Statistical Model

Important

For the rest of the activity, assume we have used the appropriate data for the analysis!!

6. State the statistical effects model for a two-factorial RCBD from Module 5.

Make sure to define **all** terms, denote i, j, m values, and include assumptions.

7. Fill in the skeleton ANOVA table for the analysis of this experiment using the RCBD analyses we have learned so far. (delete rows you don't need)

Source of Variation	DF
---------------------	----

Part C: R Analysis

7. Fill in the appropriate *R formula* to fit the model assuming that you are using the data (called `cheese_dat`) from Q5:

```
cheese_mod <- lm(_____,
                 data = cheese_dat)
```

i Output for Q8-10

```
levels(cheese_data$milk)
```

```
[1] "Organic Local"      "Organic Lucern"      "Regular Local"
[4] "Regular Lucern"     "Unpasteurized Local" "Unpasteurized Lucern"
```

```
levels(cheese_data$citric_acid)
```

```
[1] "1 tsp."    "1.25 tsp." "1.5 tsp."  "1.75 tsp."
```

```
levels(cheese_data$salt)
```

```
[1] "1 tsp." "2 tsp."
```

```
summary(cheese_mod)
```

```
Call:
lm(formula = mean_moisture_perc ~ citric_acid + salt + citric_acid:salt +
    milk, data = cheese_data)
```

8. Based on the output provided, was blocking helpful in this study? How do you know?

9. Based on the output provided, what is the **estimated** mean moisture content for a cheese made from the following. Show all work!

- local organic milk
- 1 tsp citric acid and
- 2 tsp cheese salt

10. Based on the output provided, what effects should we consider for further the analysis? (e.g. interaction effects of main effects of)

11. Describe the nature of the interaction, if any, based on the plot below.

i Output for Q11

```
emmip(cheese_mod, salt ~ citric_acid, CIs = TRUE, adjust = "tukey") +  
  labs(y = "Mean Moisture %",  
       x = "Citric Acid")
```

Part D: Conclusions and Follow-Up

i Output for Q12

```

1.75 tsp.	57.4	0.43	35	56.3	58.5	A
1.5 tsp.	55.3	0.43	35	54.2	56.4	B
1.25 tsp.	55.0	0.43	35	53.8	56.1	B
1 tsp.	54.6	0.43	35	53.5	55.7	B

salt = 2 tsp.:

citric_acid	emmean	SE	df	lower.CL	upper.CL	.group
1.5 tsp.	56.0	0.43	35	54.8	57.1	A
1.75 tsp.	55.3	0.43	35	54.2	56.4	A
1.25 tsp.	55.3	0.43	35	54.1	56.4	A
1 tsp.	55.0	0.43	35	53.8	56.1	A

Results are averaged over the levels of: milk

Confidence level used: 0.95

Conf-level adjustment: sidak method for 4 estimates

P value adjustment: tukey method for comparing a family of 4 estimates

significance level used: alpha = 0.05

NOTE: If two or more means share the same grouping symbol,
then we cannot show them to be different.

But we also did not show them to be the same.

12 Based on the analyses shown, do you have a recommendation in terms of salt and citric acid for cheese makers trying to make a mozzarella cheese with the highest moisture content?

13. To what population can we generalize results from this study?

14. Suppose the researchers were also interested in whether the effect of citric acid on the moisture depends on milk type. Why would this be difficult or impossible to assess using the current design?
